

Opening GeoDataBase Files in QGIS

1. Download your Geodatabase. My favorite source of geodatabases is <https://www.census.gov/geo/maps-data/data/tiger-data.html>
2. Then open QGIS
3. Go to **Project —> New**
4. Then go to **Layer —> Add Vector Layer** and choose the **Directory** option. For the **Type** if you're using the Tiger Census files, select the **US Census** option.
5. Then it will probably ask you what layers you want.
6. Now you can use MMQGIS to export to CSV if you want the attributes and nodes. Use Tutorial_2_C_CSVMap to see more.

And email for help!!!

Thanks all!
